

## Covid in Children

### Abstract

Currently the whole world is facing a great challenge. Last two years made our life totally different. This is the COVID -19 eras. And the age group which is suffering the most is the below 18 group. Not only the physical morbidity, this pandemic is spoiling their social and language development too. Kids who are in the transition phase like school entry group whether it is play school or main school or the college are totally in confused stage. Even the toddlers that are 1-3 years old kids are much delayed in development. Till now in India we have come across three waves of covid -19 pandemic. In the first wave, children were mostly untouched from the paws of the virus; it can be their innate immunity or that naivety of the virus, which kept them protected.
